Nov. 8, 2011

This release is recommended for all current APL+Win subscribers
that have prior versions of APL+Win installed. Current APL+Win
subscribers can download the update from
http://www.apl2000.com/software.php.

The APL+Win v11 release includes the following important new updates:

Installer: The "Initial Workspace" startup parameter in the
APLW.INI is now restored upon completion of the FixUCMDS function
in the FIXUCMDS workspace that is initially loaded after APL+Win
is installed.

Installer: Any user-defined entry in the User Command file
(UCMDS.SF) is now preserved upon completion of the FixUCMDS
function in the FIXUCMDS workspace that is initially loaded after
APL+Win is installed.

Interpreter: ⎕CMD now supports a command line buffer length of
8192 characters; previously 256 characters.

Interpreter: The grade-up and grade-down primitive functions
now has ⎕AV as the default character grade left argument.

Documentation: The v10 Supplement Manuals have been incorporated
into the traditional User Manual, System Functions Manual and
Windows Reference Manual.

Help Files: The help files were updated to allow the APL symbols
to correctly appear with Internet Explorer 9 installed.

Session: The session supports screen font magnifiction viathe
Ctrl key and the scrolling mouse wheel.

Ctrl + Scroll Forward: Increases the font size

Ctrl + Scroll Backward: Decreases the font size

The APL+Win v11 release includes the following important fixes:

Bug Fix [Interpreter]: In a clear 2049 MB workspace, APL+Win crashed when executing

a←102245500 21ρ'k1'

instead of reporting a WS FULL (workspace full) message.

Bug Fix [Interpreter]: APL+Win 10 crashed when executing the following command in a clear WS:

300 ⍕ 1ER

for R greater than or equal to 215.

Bug Fix [Interpreter]: APL+Win version 10 crashed when executing ⎕NRENAME on a native file.

Bug Fix [Interpreter]: APL+Win version 10 reported DESTINATION ERROR when executing the branch inside an execute context such ⍎, ⎕ELX or ⎕ALX handing in a :FOR loop.

Bug Fix [APL GUI]: APL+Win versions 4.0 to 10.3 crashed when disabling a Combo Box with the style property 4096 (Indents and images enabled).

Bug Fix [APL GUI]: APL+Win versions 7.2 to 10.3 did not display accented letters in the tooltips in the Statusbar control.

Bug Fix [APL GUI]: The date was incorrectly reported in the onListing handler for files in the Zip class when the Windows short date format was set to "yyyy-MM-dd".

Bug Fix [APL GUI]: A style 4 (sorted) combo box did not correctly return the names in the list property when the names contained trailing blank spaces. Note that the new behavior is to return list as a normalized nested vector for a style 4 combo box.

Bug Fix [APL GUI]: Disabling a Frame with a Label on a Page of a Selector didn't disable the Label.

Bug Fix [Session]: The session manager toolbars didn't display correctly when Undocked from the Toolbars dialog accessed from the View\Customize Toolbars menu.

Bug Fix [Session]: Docking the Standard Toolbar containing the Help button to the right and left edges of the session displayed extraneous vertical separator lines in the toolbar. Note: The separate drop-down button adjacent to the help button was eliminated. However, clicking the help button continues to display the drop-down list of help files.
